Two 750s and a 1000 F the Yoshi 750 has o.Please follow the instructions below if you are affected. Datatool S4 Series Alarm This notice is being sent to you in accordance with the Code of Practice on safety defects, as agreed between the Department for Transport and the representative Trade Associations and in compliance with the UK General Product Safety Regulations 2005. This safety recall is being monitored by the Driver and Vehicle Standards Agency DVSA who are the government agency responsible for these matters. As part of our ongoing product evaluation, it has become apparent that a limited number of Datatool S4 Red series alarms, also sold as the Triumph Approved Accessory alarm system, may suffer operational issues which ultimately lead to the motorcycle becoming immobilised. In light of the safety im plications and potential for customer dissatisfaction, we have decided to undertake a recall campaign to replace all affected units free of charge. To understand if you have an alarm system that is affected by this issue, please check the alarm serial num ber as detailed on your installation certificate or on the underside of the alarm itself and refer to the following identification procedure. If you have had an alarm system replaced previously under warranty please make sure you check the serial number of the later alarm.<http://cuacuonanbinh.com/userfiles/hp-2570p-docking-station-manual.xml>

- **datatool s4 alarm manual, datatool s4 red manual, datatool s4 red instructions, datatool s4 alarm manual download, datatool s4 alarm manual pdf, datatool s4 alarm manual free, datatool s4 alarm manual 2017.**

The Datatool S4 Red product code is 0200 0 140, the Triumph branded alarm product code is 02000240. Note If you have any other product code this service campaign does not apply to your alarm. It is possible your dealer has not provided the full serial number when registering your alarm, if so you may only have the production sequence number recorded on your certificate. In this instance please check the alarm itself to confirm you have a Datatool S4 Red with red casing seals and not a S4 Green with green casing seals. There is only one version of the Triumph branded alarm. Example 02000140 31 15 0001 would be a n alarm manufactured in 2015 Only certain alarms produced between 2013 and 2016 are subject to replacement so if your alarm has anything other than 13, 14, 15 or 16 as the 3 rd and 4 th digits this service campaign does not apply to your alarm. Example 02000140 31 15 0001 would be an alarm manufactured in week 31 of 2015. We can then make arrangements for the alarm to be replaced. Important If your alarm is already exhibiting the symptoms detailed above we strongly recommend you do not ride your motorcycle. We appreciate this may cause inconvenience but we consider rider safety to be of paramount importance. Some at these leatures can only be adjusted by yourWe also advise you read this manual carelully andThis manual covers the tollowing products. 2011 keep it safe for future reference. Please Read. To start viewing messages, Yamaha MT01. Honda CBF600ABS. Yamaha RD250LC. Yamaha RS100. This post is for all those that fancy making changes but aren't really sure what to do and would like a stepbystep guide. I've tried to make it simple and easy to follow, but read it properly first and use it in tandem with the information shown in the Datatool S4 user guide. Everything is shown in sequence. Ignition key actions will be denoted as or.

Always leave in the last state noted, so if the line finishes with then the ignition key should be left in that state and not turned off, otherwise the sequence will be ruined and you will have to start again from scratch. So as not to get confused with other double beeps let us assume that for the system we are working on the PIN has been set to 3434. The starting state for all exercises is with the bike in a fully armed state with the ignition switch in the position. Allow system to activate and then trigger alarm to hear your new tone. Allow system to activate. Me I prefer having that audible confirmation. End of exercises! Use these same methods to make other changes as you see fit. I hope you enjoy properly customising your Datatool S4 alarm system without the cost of taking it to a dealer. LaZImage resizer by SevenSkins. Last edited by Troglet on 0914 04 May 2016; edited 1 time in total In all honesty, I ripped my S4 out as it fried its own electrics unexpectedly one day and left me stranded at a mates house. I'd not chance that happening again so it'd be in the bin if it was mine. In all honesty, I ripped my S4 out as it fried its own electrics unexpectedly one day and left me stranded at a mates house. I'd not chance that happening again so it'd be in the bin if it was mine.

You're telling me I can just grab something sharp and cut that fucker out. On the Triumph it was factory fit so it had a factory fit harness on it, which plugged into the loom. Once it was removed, I needed a bridging plug to remake the connections for the starter as the loom was now open ended. On the Triumph it was factory fit so it had a factory fit harness on it, which plugged into the loom. Once it was removed, I needed a bridging plug to remake the connections for the starter as the loom was now open ended. This thing is, predictably, tucked up nice and snug under the fuel tank towards the front of the seat. I'm going to look through the bike's manual and see about removing the seat to get a better look at it. These things can't be perfect, lockpickers, hackers and general miscreants should have figured this out. In all honesty, I ripped my S4 out as it fried its own electrics unexpectedly one day and left me stranded at a mates house. I'd not chance that happening again so it'd be in the bin if it was mine. Although the battery had only been on charge 5 or 6 hours and had yet to fill, perhaps not enough. Hopefully that'll fix it. Maybe have a look on gumtree, you might find some Polish guy who will do it cheap. Your looking at about 50. Maybe have a look on gumtree, you might find some Polish guy who will do it cheap. Your looking at about 50. I'm one of those. Not a penny to my name. Also it's 50 for the hours labor and another 50 for pickup, unless I push it a couple miles to the garage. Thanks anyway though. If a monkey has fitted it it'll be as obvious as hell which wires you'll have to reconnect. Give it a go yourself. Nothing to lose. I've just scanned it and there's a number of possibilities including it being in sleep mode which needs a different sequence of button presses to reactivate it properly with the remote.

I've just scanned it and there's a number of possibilities including it being in sleep mode which needs a different sequence of button presses to reactivate it properly with the remote. I think the alarm is bricked and in turn bricked the bike. Nothing to lose. Would the back up battery need to be replaced

for the alarm to work correctly Would the back up battery need to be replaced for the alarm to work correctly Current 2016 Kawasaki ER6f. Instead of replying here, would creating a new thread be more useful If your rating is revoked you will lose karma Have you read the ratings guide If your rating is revoked you will lose karma Have you read the ratings guide. To start viewing messages, The instruction book doesn't tell you. I've had a system 3 in the past and that method alarm off key on press small button wait for beep key off doesn't work with the system 4. Any ideas Many thanks 750I guess you need to give them a call Al Then plug me back in. See if that works. The instruction book doesn't tell you. I've had a system 3 in the past and that method alarm off key on press small button wait for beep key off doesn't work with the system 4. Any ideas Many thanks 750 With mine you disarm the alarm, turn ignition on and then press and hold the triangle button until it beeps. The Led lights up and the alarm will beep every minute or so. Hope this helps. If you want to remove the battery just allow the bike to immobilise itself then remove the battery as normal. The reason for this is that the system 3 used to set itself with the motion sensor on, so you needed service mode to work on the bike without the alarm going off every time you move it. With the S4 you have to turn on the motion sensor yourself. I hope this helps. So I'll try waiting for it to set and then remove seat. Last time I did it I couldn't hear for the rest of the day system 4 siren seems louder than system 3!!!!

It probably explains when I nudge my GSXR System 3 all hell breaks loose in the garage and when I nudge the GS nothing happens!!! Just thought the GS was so heavy you had to give it a really big nudge to set it off. I just wanted to clean the bike and fiddle as you do!!! etc. Thanks again Nick Wicklow March 27th March 29th March 2015 Donegal Friday 30th Sunday 1st April 2007 Pre event planning These objects may not be copied for your use of. It may not display this or other websites correctly. You should upgrade or use an alternative browser. Does anyone know how I can put this in a mode so that the alarm does not keep alarming itself. Every time I disconnect it from the battery it goes off. need to sort the wiring out. and it's becoming a pain to having to keep disarming it. Also I have broken my led. the wires have come away from the led bulb. any one know if I can get a replacement and solder it to the existing wire Thanks They are about as useful as a chocolate teapot. Traced the wiring back to the original bike loom and simply cut them off one at a time, securely taping up the connections with good quality electrical tape and remaking the bike loom back to original with self amalgamating tape. If you have issues as you describe then the alarm could be in on its way out. It's in the instruction manual If you scroll down to How to remove your machine battery. This should sort you out. I had my C4 installed last year, as I needed some noise if anyone tampers with my bike outside the house on the odd occasions it's left out. Not had issues so far touch wood I do however have my bike hooked to a optimate charger and not used it for nearly a year. lol He is brilliant at what he does. This is his website if you cannot find the answer give him a phone. Hope this helps. IIRC there is only 3 or wires actually connected to the bike loom and the loom isn't cut into, the Datatool wires are spliced into it.

I think there are 8 or 10 wires on the datatool loom but 4 are for the tilt sensors, 2 for the led and the rest are 1 power feed, 1 into the kill switch feed and 2 into the indicators. The tilt switches and led connections should be on plugs so easily identified, so leaving the 4 to the bike, so, if you don't fancy tracing back the wires to the bike loom, you could just cut them 1 at a time and either electricians tape the cut ends up, or get a small connector block and secure the cut ends into it so they can't touch. IIRC there is only 3 or wires actually connected to the bike loom and the loom isn't cut into, the Datatool wires are spliced into it.
